

ONE CONNECTION.
ONE COMMUNITY.
COUNTLESS OPPORTUNITIES.

THE CORESITE OPEN CLOUD EXCHANGE

A ONE-TO-MANY CONNECTION TO COUNTLESS OPPORTUNITIES

The CoreSite Open Cloud Exchange is an Ethernet switching product enabling private virtual connections for direct cloud access, all with near real-time provisioning. Established in 2013, the CoreSite Open Cloud Exchange is one of the first exchange platforms of its kind, built to virtually unite networks, cloud providers and enterprises through an on-demand interconnection portal.

Unlike connecting to cloud services using the public Internet, the CoreSite Open Cloud Exchange establishes direct, secure,

virtual connections—enabling more control, reliability, and security for your data. This allows you to deliver your data more efficiently, all with guaranteed throughput and reduced latency.

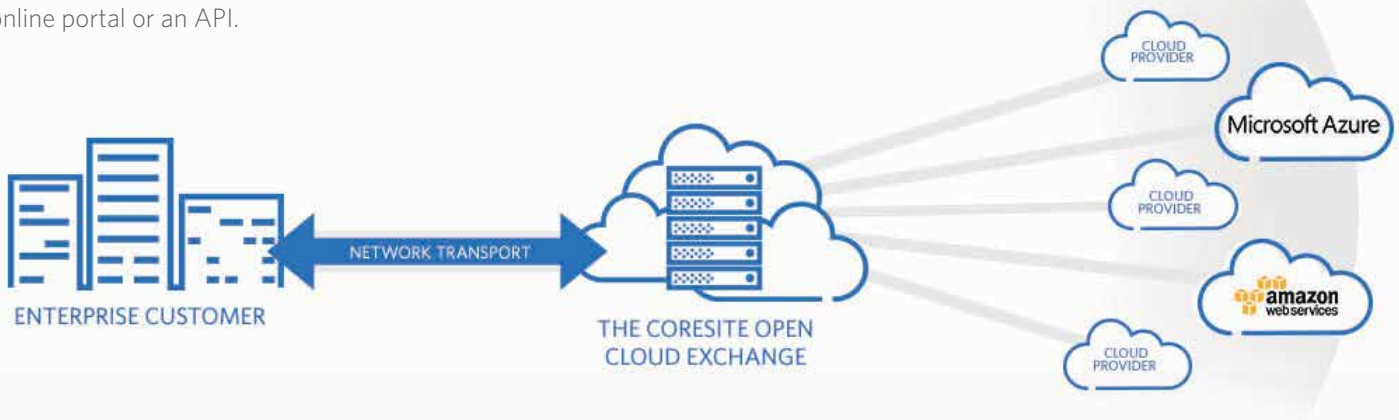

And, the Open Cloud Exchange online portal allows on-demand access for CoreSite customers to interface directly to virtual cloud environments. Through their individualized portals, customers maintain control of their data in real time, providing the scalability and elasticity essential for cloud applications.

BENEFITS TO YOU

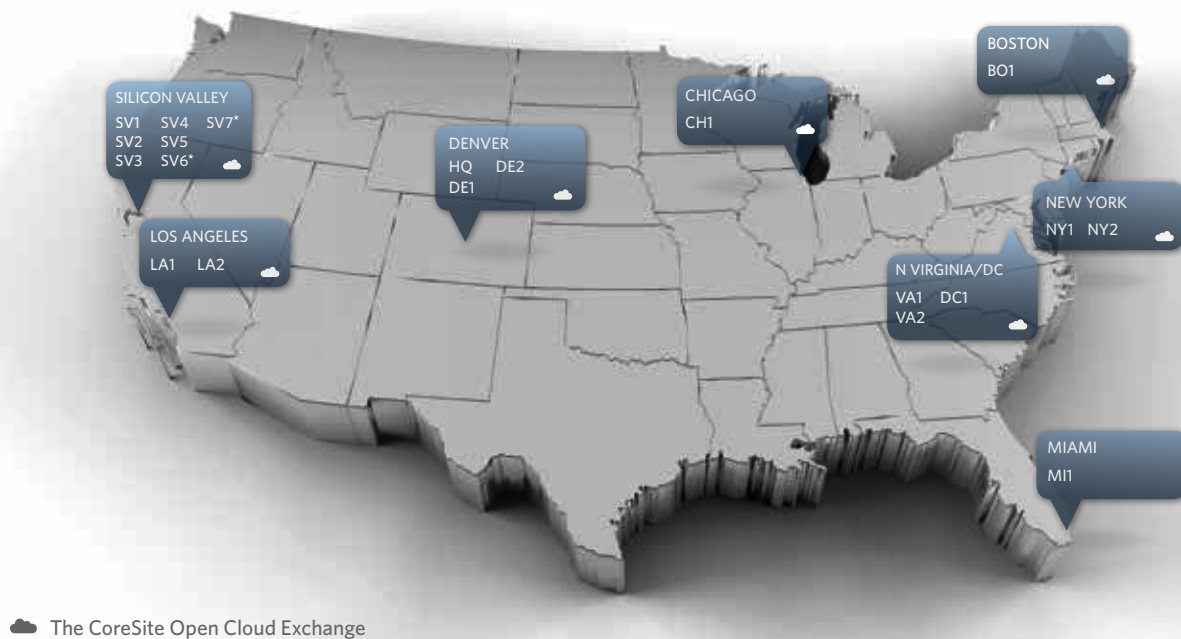

- **On-Demand Provisioning:** Provides the ability to directly manage connections in near real time through the online user portal or API
- **One-to-Many Connection Capabilities:** The activation of a single port allows users to establish multiple virtual interfaces with our growing community of participants
- **Secure Connections:** Direct connections offer private network isolation and are more secure than connecting through the public Internet
- **Guaranteed Throughput Quality:** High bandwidth network connections offer guaranteed throughput and lower latency compared to public Internet connections

HOW IT WORKS

The CoreSite Open Cloud Exchange works by providing your company with a single connection to our secure exchange community. Through this Ethernet exchange, your company can connect to a multitude of cloud and IT service providers. Provisioning is done in real time through a private online portal or an API.
